

## Grande Prairie Manlift Certification

Grande Prairie Manlift Certification - The Manlifts and Elevated Platforms course provides training on the regulations, rules and correct application of safe operating measures and work practices involved in daily activities for people who work making use of this machinery. The program has been designed for individuals who are actively involved in these activities or those who have a basic knowledge of this equipment.

manlifts and aerial platforms have become integral and common machines in industrial settings in the past few decades. These machinery provide an easy way to lift workers near what must be performed on a stable platform apparatus, allowing workers to carry out tasks with greater comfort and safety rather than being perched on top of scaffolding or ladders.

Like every other device, manlifts are just safe when they are used properly. Since they lift workers above ground level or floor, accidents can take place easily and this can lead to serious fatalities or injuries for both the operators of the manlift and any passerby who might be unlucky enough to be standing below.

There are different kinds of manlifts. The majority fall into 1 of 2 categories: the articulating boom lift, which has the capability of both horizontal and vertical movement and the scissors lift, that is capable of moving up and down.

### Protecting Workers

It is vital to provide proper training for you operators. A lot of companies that rent these machines will provide on site training. Every worker who will be working on the equipment or operating it should receive training in safe operations. It is likewise vital that just those workers who have received training should be authorized to operate the controls. Operating procedures and communication rules must be clear. Hence, employees on the ground must not operate controls without the approval and knowledge of any staff in the basket.

The employees that occupy the basket will be required to wear the proper fall protection gear that consists of a lanyard and harness. The fall protection attaches to the manlift easily. The worker must make certain that he or she has made any adjustments needed to reflect the change in fall distance if the height of the work area changes.

Manlifts need to be inspected and tested each day to make sure they are in safe operating condition. Prior to the machine being used, any defects should be re-checked and fixed.
