

Grande Prairie Scissor Lift Safety Training

Grande Prairie Scissor Lift Safety Training - A scissor lift is a type of platform lift which moves vertically. The lift table is moved in a vertical motion due to criss-cross folding supports that are connected in what is called a pantograph. The platform could propel vertically because of the application of pressure to the outside of the lowest set of supports. This elongates the crossing pattern and causes the machine to rise. Some types of scissor lift likewise have an extending "bridge" which allows operators to have closer access to the work area as the vertical only movement can have some inherent restrictions.

Scissor Lifts can contract by a variety of means like for instance mechanical, via a rack and pinion or lead screw system, or hydraulic or pneumatic. There are different types existing on the market. Some models may require no power to enter "descent" mode but instead rely on a simple release of pneumatic or hydraulic pressure that depends on the power system utilized. These hydraulic and pneumatic methods of powering these lifts are preferred as releasing a manual valve gives a fail-safe option of returning the platform to the ground.
